AB A **review** with 21 refs. Biotechnol. approaches are of increasing application and use for medicinal plants and secondary metabolite prodn. Micropropagation allows the prodn. of pathogen-free plants with uniform quality for agronomic cultures and also for germplasm conservation. Plant in vitro culture allows the prodn. of secondary metabolites under controlled culture conditions. Two types of in vitro cultures are currently used for secondary metabolite prodn.: dedifferentiated cultures (callus and suspension cultures) and differentiated cultures (transformed roots and shoots). The former tends to accumulate secondary metabolites only in small amt. compared to the whole plant. The approaches used for increasing the prodn. of secondary metabolites include optimization of growth and prodn. culture media, as well as elicitation and metabolic engineering.
